

Influence_Consensus_agr_edua - In society, does Agriculture alone generally have a direct effect on the access to education (excluding the cost or quality of education), or are observed relationships primarily indirect? If a direct effect exists, is it negative, none, negligible, or positive? What would be a reasonable normalized magnitude for this influence on a scale from -1.00 to 1.00? Please only provide evidence for only direct influences

Agriculture alone does not appear to have a direct causal effect on access to education when excluding factors like cost or quality; observed relationships are primarily indirect. For example, increases in agricultural exports have been linked to reduced years of education due to increased child labor, indicating an indirect negative effect rather than a direct one (Lin, 2021). Studies emphasize that education related to agriculture, such as Agricultural Science curricula, influences engagement and knowledge but this reflects educational content rather than agriculture directly affecting access (S.M., 2025). Research also shows that education improves agricultural productivity and farm efficiency, but these effects stem from education's role in skill acquisition rather than agriculture directly enabling or restricting access to schooling (Huffman, 2000; Jamison, 1982). Evidence from rural school construction highlights that improved access to education drives shifts away from agricultural labor, suggesting causality runs from education supply to agricultural transformation, not the reverse (Charlton & Taylor, 2020; Charlton & Taylor, 2019). Given the lack of evidence for a direct causal influence of agriculture itself on access to education, the effect can be classified as negligible or none, with a normalized magnitude near 0.0 on a scale from -1.00 to 1.00.
