

Influence_Consensus_agr_eduq - In society, does Agriculture alone generally have a direct effect on the quality of education (excluding the accessibility to or cost of education), or are observed relationships primarily indirect? If a direct effect exists, is it negative, none, negligible, or positive? What would be a reasonable normalized magnitude for this influence on a scale from -1.00 to 1.00? Please only provide evidence for only direct influences

Agriculture alone generally does not have a strong direct effect on the quality of education; most observed relationships are indirect or mediated by other factors. For example, agricultural exports can reduce years of schooling through increased child labor, which indirectly affects educational outcomes rather than directly lowering education quality (Lin, 2021). Studies comparing biology knowledge acquisition in farm versus school settings found no significant difference in learning quality, suggesting that agricultural environments do not directly diminish educational quality (Malariková et al., 2023). Challenges in agricultural education quality often stem from social problems, lack of practical training, and outdated curricula rather than agriculture itself directly impacting education quality (Astrakhantseva, 2021; Haryanta et al., 2025). While agricultural education can improve skills relevant to farming and employment, this reflects the content and delivery of education rather than a direct influence of agriculture on overall education quality (S.M., 2025; Riyadh, 2020). Therefore, the direct effect of agriculture on education quality is negligible or none, with a reasonable normalized magnitude close to 0.0 on a scale from -1.00 to 1.00.
