

Influence_Consensus_agr_fam - In society, does Agriculture alone generally have a direct effect on Family Orientation (including positive family values), or are observed relationships primarily indirect? If a direct effect exists, is it negative, none, negligible, or positive? What would be a reasonable normalized magnitude for this influence on a scale from -1.00 to 1.00? Please only provide evidence for only direct influences

The direct influence of agriculture on family orientation, including positive family values, appears to be complex and multifaceted rather than straightforwardly positive or negative. Agriculture as a family activity shapes identities and roles within farming households, particularly through family labor dynamics such as succession and gender roles, which are integral to the resilience of family farms but can also lead to stress and mental health challenges (Forney & Sutherland, 2021). Family involvement in farming influences social sustainability goals but does not strongly affect economic or environmental sustainability goals directly (Nybom, 2023). Parents' aspirations and farm characteristics strongly shape youth's farming aspirations, indicating a direct familial influence embedded in agricultural contexts (Nandi et al., 2022; Ogunjimi et al., 2022). However, some evidence suggests that strong family identity may negatively affect farmers' engagement in environment-friendly production behaviors, though this effect is moderated by place identity (Li et al., 2023). Overall, the direct effect of agriculture on family orientation is generally positive but nuanced, with a reasonable normalized magnitude likely around +0.3 to +0.5, reflecting moderate positive influence mediated by social and identity factors within farming families.
