"David Bright and Chad Whelan have written a must-read primer for anyone seeking to understand, investigate, or respond to organised crime. Combining research findings with practical examples from the field, this book illustrates how surveillance, detection and enforcement efforts to disrupt organized crime benefit from adopting a network perspective."

Gisela Bichler, *Professor of Criminology, California State University, San Bernadino, USA*

"At a general level, social theory has long observed social relations in terms of networks. This book neatly brings together what is understood about how concepts concerning social networks informs thinking about both crime and law enforcement. Readers will benefit from the clear elucidation of research and theory in this policy domain."

James Sheptycki, *Professor of Criminology, York University, Toronto, Canada*

"This is a timely, lucid, and well-informed examination of the network perspective as it relates to organized crime and organized crime control. The main emphasis is on the potential, as well as on the limitations, of conceptualizing organized crime in terms of criminal networks … In many ways, this book is a valuable contribution to the literature."

Klaus von Lampe, *Professor of Criminology, Berlin School of Economics and Law, Germany*

Organised Crime and Law Enforcement

Organised Crime and Law Enforcement: A Network Perspective examines organised crime and law enforcement through the conceptual lens of *networks*. The book takes stock of the many ways in which network theories and concepts, including social network analysis, can apply to studying both organised crime and law enforcement responses to organised crime. It is the first attempt to bring these diverse network perspectives and distinct fields of research together.

The book is organised into two parts. The first part uses network perspectives to advance understanding of the interconnected social structure of organised criminal groups, to expose their strengths and vulnerabilities, and to illuminate factors that enable such groups to undertake complex criminal activities. The second part uses a network lens to examine the challenges that organised criminal groups present for a wide range of law enforcement agencies, and the utility of network theories and concepts in understanding and informing their responses to organised crime.

Written in a clear and direct style, the book will appeal to scholars and practitioners of criminology, sociology, law enforcement, and all those interested in learning more about theories of organised crime and its relationship with law enforcement.

David Bright is an Associate Professor of Criminology with the Centre for Crime Policy and Research at Flinders University, Adelaide, Australia.

Chad Whelan is an Associate Professor of Criminology in the School of Humanities and Social Sciences at Deakin University, Geelong, Australia

Routledge Studies in Organised Crime

This series offers a forum for international academic research that advances understandings of the nature of organised crime, its representations, and the policies and practices surrounding it. *Routledge Studies in Organised Crime* is the home for cross-cutting, empirically and theoretically ambitious studies as well as impactful academic-practitioner collaborations, drawing from a wide range of geographical, cultural, political, and social contexts.

Acknowledgements

This book would not be possible without the support of many people. First, we would like to acknowledge the essential contribution of all of our interviewees, who willingly made time for this project in their busy schedules. The second half of the book could not have been written without their input. Of course, the views expressed in the book are ours and are not those of any organisation mentioned in the book, and responsibility for any errors of omission or commission in the book remains with us.

Second, we would like to thank the many research assistants who have worked with us during this project, including Adrian Leiva, Sharyn Goudie, Marie Hadley, and Brydan Xavier.

Third, we wish to thank a number of our academic colleagues, including participants of Illicit Networks Workshop and Policing Of/Through Flows workshops held in London, United Kingdom (2016), Adelaide, Australia (2017), Seattle, United States (2018) and Montreal, Canada (2019). There are too many names to mention, but many people have helped shape our ideas on various aspects of this project. We thank various anonymous reviewers of other publications we have completed during this project. We would also like to extend thanks to a number of our colleagues at who gave us feedback in various stages of this project, including Andrew Goldsmith, Martin Bouchard, and Russell Brewer. Once again, any errors or omissions are our own.

Finally, we would like to acknowledge the support and mentorship of our colleague and friend, Carlo Morselli, who sadly passed away in October 2020. In addition to pioneering the field of criminal networks as a whole, he has contributed to the development of our ideas in more ways than we could possibly mention. He will be sorely missed.

Chapter 1

Introduction

Organised crime and law enforcement

The concept of *organised crime* has captured the attention of novelists, screenwriters, and journalists as much as that of law enforcement agencies and governments. Organised crime tends to evoke dramatic images involving corruption, power, violence, and vast wealth. Yet, pinning down an actual definition of organised crime and, perhaps more so, the costs and harms of organised crime is a difficult and rare undertaking. Many definitions conflate *serious* and *organised* crime to involve groups of three or more individuals planning and carrying out an incredibly broad range of criminal activities. A result of such a loose definition is that attempts to assess the economic and social costs of organised crime, when they have been undertaken, have significantly differed in their approach and validity. The United Nations Office on Drugs and Crime (2012) estimated that global revenues generated from organised crime amounted to USD900 billion (United States dollars), or approximately 1.5 per cent of global gross domestic product (GDP). In Europe, a European Commission sponsored study of organised crime revenues produced an estimate of about 1 per cent of the European Union's GDP (Savona & Riccardi, 2015). Some commentators have suggested that both studies are likely to be generous in their estimates (Reuter & Tonry, 2020). In the United Kingdom, estimates have placed the annual impact of organised crime at GBP37 billion (British Pound Sterling) (Fell et al., 2019), while in Australia, studies have concluded that estimates can vary between AUD23.8 billion (Australian dollars) through to AUD47.4 billion, depending on how they are calculated (Smith, 2018). These higher costs include estimates of the costs to law enforcement, the criminal justice system, other government agencies, the private sector, and communities. Of course, these estimates are just that, estimates, because the very nature of organised crime is to keep their activities and finances hidden. Nonetheless, although definitions of the concept, the scope of activities, and the method of calculating costs and harms vary, there is growing evidence that organised crime is a significant economic, political, and social problem.

Recent trends in organised crime research have highlighted the complexity and diversity of organised crime. In particular, researchers have concentrated on the ways in which organised criminal groups mobilise across borders (e.g., Duijn, Kashirin, & Sloot, 2014; Hignett, 2012; Sergi, 2019; Varese, 2004, 2011, 2020; von Lampe, 2013; Williams, 2001b). Other research has focussed more on the multifaced nature of organised crime. For example, mafia-style organisations and outlaw motorcycle gangs can be reasonably expected to have many similarities in the ways in which they operate and behave, but they also have some significant differences (see e.g., von Lampe & Blokland, 2020). Research has also emphasised notable differences among criminal groups within established categories, including between the Italian mafias Cosa Nostra, Camorra, and 'Ndrangheta (e.g., Calandra, 2017; Catino, 2020; Europol, 2013; Peluso, 2013; Scaglione, 2016; Sergi, 2015; Varese, 2006), and outlaw motorcycle gangs (e.g., Barker, 2014; Harris, 2016; Klement, 2016; Lauchs, Bain, & Bell, 2015; Piano, 2018; von Lampe & Blokland, 2020). A number of useful studies have described various features of organised criminal groups (e.g., Adamoli et al., 1998; Gambetta, 2009; Kleemans & Soudijn, 2017; Pearson & Hobbs, 2003; von Lampe, 2015), while a few have conducted meaningful comparative studies (e.g., Paoli & Reuter, 2020; Smith, 2018; Varese, 2011). Research has also concentrated on the relationships between criminal organisations (including collaboration and conflict, e.g., Adamoli et al., 1998; Catino, 2014; Hofmann & Gallupe, 2015), the criminal careers of organised criminals (e.g., Blokland et al., 2019; Fuller, Morgan, & Brown, 2018; Kleemans & De Poot, 2008; Kleemans & Van Koppen, 2020; Van Koppen, de Poot, & Blokland, 2010), and disengagement from organised crime (e.g., Bovenkerk, 2011; Campbell & Hansen, 2012; Douglas & Smith, 2018; Smith, 2014). While research has undoubtedly grown, there remains relatively limited scholarly attention on organised crime compared to many other forms of crime (Reuter & Tonry, 2020). There are many reasons for this, but, at this point, it is sufficient to note that research on organised crime is challenging: its conceptualisation is contested, and reliable empirical data are hard to find.

One emerging area of research that we would like to call particular attention to is concerned with the 'organisation of organised crime' (e.g., Bouchard, 2020; Calderoni et al., 2020; Campana, 2011; Catino, 2020; Varese, 2012; von Lampe, 2012). Over the past two decades, a significant trend in the literature has noted a shift from more hierarchical modes of organising to what are loosely referred to as 'networks' (e.g., Calderoni, 2014; Morselli, 2009; Paoli, 2002). This has been in distinct contrast to conceptions of organised crime in popular culture, as portrayed in films and television series, such as *The Godfather* and *The Sopranos*. These images portray organised crime with a fairly clear organisational structure, with a boss or 'godfather' at the top, an underboss or counsellors immediately underneath, and several captains overseeing a crew of soldiers ('made men') and associates (Abadinsky, 2012; Albini, 1971; Cressey, 1969; Jacobs, 2020). Many scholars have used the term 'network' as a

metaphor rather than as a method or approach to analysing organised crime to simply denote a shift away from this rigid structure. Others have used the term in relation to broader trends in globalisation and the accompanying technological and social changes that have, of course, impacted all aspects of society along with organised crime, as encapsulated in Castells' (2000) trilogy on 'the network society'. The network concept has thus been employed in many contexts of organised crime research, ranging from demonstrating the transnational features of organised crime through to the resilience of networked criminal organisations.

The challenges that 'networked' criminal organisations pose for governments have attracted significant scholarly attention (e.g., Calderoni, 2014; Eilstrup-Sangiovanni & Jones, 2008; Kenney, 2007; Raab & Milward, 2003; Williams, 2001a). Networks, as loose associations of criminals collaborating in a cooperative venture, often have no obvious centre of gravity, making decisions about where to target resources a challenge. Given the branching and interconnecting nature of networks, law enforcement agencies have difficulties untangling such connections. Examples include tracing the transnational nature of organised crime, corruption, financial flows, and interconnections between legitimate and illegitimate business. In light of these challenges, numerous conventions and bilateral, regional, and international agreements have been established that seek to improve the capacities of countries to respond to organised crime. In general terms, these governmental responses increase the consistency of laws designed to prevent and prosecute organised crime, provide greater scope for police and law enforcement agencies to investigate and disrupt organised crime, and enhance information and intelligence sharing among agencies responsible for controlling organised crime. These responses can be seen within and between many developed countries in an effort to achieve enhanced coordination and collaboration across both organisational boundaries spanning professional disciplines and jurisdictions. That is, the response to organised crime involves the deliberate formation of law enforcement it may take networks to fight networks (p. 327) (e.g., Whelan & Dupont, 2017). In some discourses, these developments have been linked to the idea that 'it takes networks to fight networks' (Arquilla & Ronfeldt, 2001). However, as we shall see, there is much more involved in understanding and analysing networks than this perspective would imply.

The principal aim of this book is to take a network perspective to the study of organised crime *and* law enforcement responses to organised crime. It is not a comprehensive book about organised crime or law enforcement responses to organised crime. We aim to demonstrate how network theories and concepts can advance our knowledge of how criminal organisations form and function as well as operate and behave. We also aim to show how network perspectives can apply to law enforcement efforts to disrupt organised crime. To that end, we synthesise existing research and suggest directions for future research in the areas we believe will be most useful moving forward. We do not intend for our observations to be the final word on the topic; rather, we hope to provide

a useful summary of the literature as well as relevant theories and concepts that will provide a helpful starting point for those new to the topic and to stimulate further inquiry in this field. The book adopts a broad interpretation of 'law enforcement' to include those actors that have some role in preventing, disrupting, or prosecuting organised crime, with our principal focus being on criminal intelligence and related agencies, which is again broadly defined in the context of the book. We include the activities of police, criminal intelligence, border, regulation, and revenue agencies, for example, as having a role in responding to organised crime. The focus of the book, however, is not on any single entity or a narrow conception of law enforcement strategies and approaches. In keeping with the principles of a network perspective, our focus is on the *relational* attributes of a wide range of law enforcement actors across the field of organised crime. We will elaborate on this overall aim as we turn to what we mean by a network perspective.

A network perspective

Network perspectives are becoming increasingly popular in the literature. A large body of literature has emerged that applies network theories, concepts, and approaches to a broad array of crime and security problems as well as governmental responses to those problems. However, this rapid rise of network research has been accompanied with differing conceptions about what a network is and what network perspectives are. In much of the extant literature, the term 'network' is still evoked largely as a metaphor, denoting some form of relationship among a particular set of social entities. A network perspective is much deeper than the metaphorical use of the network concept implies. There are also quite significant differences between, for example, 'network' used in an analytical sense and when it implies a form of organisation or governance. Therefore, we feel the need to say a little about network terminology early before elaborating on this further in later chapters of this book. It should be stated at the outset that this book adopts both uses of the network concept; in particular, we adopt the analytical perspective when studying organised crime and the organisational perspective when focussing on law enforcement responses to organised crime. These two main ways in which network approaches are used could benefit from more integration. This applies even more so, we argue, to the criminological literature in which, if we exclude those adopting the metaphorical use of the network concept, most scholars use either the analytical or the network form of governance perspective.

A network is a set of actors (or nodes) that are connected by a set of relationships (or ties). Actors can be any given entity, including individuals, groups, organisations, etc. Ties can be present or absent and of any type. Each type of tie potentially defines a different network. For example, common distinctions exist between professional and social networks, kinship and friendship networks, and so on. When the focus is on a set of actors, researchers tend to

concentrate on the pattern of relational ties and the implications of such ties for actors and the network as a whole. If the focus is on a single focal actor, that actor is referred to as the 'ego' and the actors connected (or not) to that actor are known as 'alters'. Network-related theories have emerged to account for almost every aspect of organisational behaviour (e.g., Borgatti & Halgin, 2011; Robins, 2011). For instance, well-known network research has been used to examine how social networks within organisations form and function, with studies revealing some significant differences between how organisational processes and charts suggest things should be done compared with how they are actually done (e.g., Barabasi & Bonabeau, 2003; Scott, 1991). Other classic network frameworks include the network capital framework (Schwartz & Rouselle, 2009), in which the 'social capital' and 'human capital' of actors is used to determine potential outcomes or effectiveness of networks, and the strength of weak ties concept, which explains how 'weak' ties (i.e., sparse and diffused ties) between actors can be more useful than 'strong' ties (i.e., tightly clustered) when it comes to accessing new or novel information and opportunities (Granovetter, 1973). In a criminological sense, much of the literature that does not adopt a simple metaphorical use of the network concept can be addressed as either the network analysis or network forms of governance perspectives.

Network analysis is a set of methods and techniques that are used to study groups of actors. The term used in this book when referring to such techniques is social network analysis (SNA). SNA is both a theoretical approach and a set of methodological and analytical strategies. As a theoretical approach, SNA focusses on the pattern of interactions or relationships between a set of actors. As an approach to analysis, SNA draws on mathematical graph theory to analyse the patterns of ties between actors in the network, facilitating conclusions about the overall structure of networks, the subgroups within such networks, and observations about the influential or active actors that comprise the network. There is a large and growing body of literature exploring the application of these methods to a range of crime and security problems (e.g., Bouchard, 2020; Bright, Hughes, & Chalmers, 2012; Calderoni, 2014; Campana, 2016) and a much smaller body of literature exploring the connections between theory and practice (Burcher & Whelan, 2018, 2019; Hashimi & Bouchard, 2017). We recognise that there is a not insignificant body of literature applying SNA specifically to organised crime (see, e.g., Bichler, Malm, & Cooper, 2017; Bouchard, 2020). Our focus in this book is not necessarily to advance this literature but, rather, to take stock of the many ways in which SNA, and related theories and concepts, can apply to studying organised crime. As such, the primary audience of this book is likely those who are less familiar with SNA, or those who have tended to specialise in SNA but have less understanding of network perspectives overall (in which case those readers may benefit more from Part 2 of this book). It is our hope, however, that our broad examination of network analysis and related theories and concepts will

prove useful to those accustomed with a number of the network perspectives we utilise in the book.

Organisational network perspectives are adopted in the book more in relation to the activities of law enforcement agencies. Our position is influenced heavily by the public administration and management literature (e.g., Kenis & Raab, 2020; Popp et al., 2014; Provan, Fish, & Sydow, 2007; Provan & Kenis, 2008; Provan & Lemaire, 2012; Raab, Mannak, & Cambré, 2015), which approaches organisational networks as deliberately structured organisational forms whereby legally independent actors (or 'nodes') work together to achieve their own goals and also a collective goal. This approach is consistent with one of the authors' recent work on 'security networks' (Whelan & Dupont, 2017; Whelan & Molnar, 2018). When viewed in this way, security networks have two basic sets of properties: structural and relational. *Structural* properties relate to such attributes as the design of networks, the composition of actors and the pattern of their various ties. Other important structural properties include questions of internal network governance or the organisational configurations with which activities are coordinated. *Relational* properties concern the many factors shaping relationships among security actors, particularly at the interorganisational and interpersonal levels. We will analyse the underlying structural and relational dynamics and tensions relating to the formation and functioning of networks intended to respond to organised crime.

The book

The book aims to take stock of the many ways in which a network perspective applies to organised crime and law enforcement responses to organised crime. We take a broad view of 'network perspectives' to include the network as a method of analysis and the network as a form of organisation. We review existing literature and seek to provide direction for future research. At various points, we draw on empirical research we have conducted with criminal intelligence analysts and senior managers within criminal intelligence agencies, the principal one being the Australian Criminal Intelligence Commission (ACIC). The ACIC is similar to the United Kingdom's National Crime Agency and the Criminal Intelligence Service Canada and is largely responsible for coordinating criminal intelligence among local and federal police and other law enforcement agencies.

Interviews were conducted as part of our prior research into 'fusion' centres and related entities.[1] Fusion centres are essentially networks of law enforcement actors that share data, information, or intelligence for a variety of purposes. In some cases, these purposes include generating intelligence products while in other cases they are more related to coordinating activities among member agencies. We have conducted interviews with several members of the ACIC, most of whom work at managerial and executive levels, as well as interviews with representatives of many of their partner agencies. We have also

interviewed members of two additional fusion centres or related entities: the Fraud and Anti-Corruption Centre hosted by the Australian Federal Police and the Financial Intelligence Unit within the Australian Transaction Reports and Analysis Centre. In total, we have conducted 15 interviews within the ACIC (as either individual interviews or focus group participants) and more than a further 20 with members of other agencies. We use our interviewee reflections to provide a little more life to the book, particularly when reflecting on the relationship between theory and practice in the law enforcement context. It should be noted, however, that we do not use interview data to engage in an empirical analysis of any particular entity or theme related to the book.

The book proceeds in two parts. Part 1 concentrates on network perspectives as applied to organised crime. Chapter 2 defines key concepts, including organised crime, criminal organisations, and criminal networks. We also address the different frameworks within which organised crime has been studied–including hierarchies, markets, and networks–and some of the key debates in the field. Chapter 3 provides an overview of network theory and concepts relevant to the study of organised criminal groups. For example, we discuss whole-network measures and measures of positional importance in networks and the role of actor-level characteristics. Chapter 4 turns to the strengths and vulnerabilities of network configurations in the context of organised criminal groups. We consider here the resilience of networks and the implications of this for our understanding of organised crime. Chapter 5, the final chapter in Part 1, uses a network lens to analyse and understand the enablers of organised crime as well as how organised criminal groups are formed and evolve over time. This includes network perspectives on areas such as recruitment, trust, and corruption and on the role of boundaries in facilitating organised criminal groups and their activities.

Part 2 shifts the focus to network theories and concepts as applied to law enforcement. We use the term 'law enforcement' over 'policing', for example, because we seek to include a wider array of agencies, including financial, revenue, and regulatory agencies, in our analysis than police or those with policing functions. Chapter 6 seeks to map the field of recent developments in law enforcement responses to organised crime. We do this by using three trends that we heuristically employ to characterise this field of law enforcement: expanding the reach of responses to organised crime, expanding the players or agencies entering this law enforcement field, and expanding the techniques used to disrupt and prosecute organised crime. Chapter 7 turns to focus more on disruption techniques. We seek to illustrate here how network perspectives can be used to understand and analyse various law enforcement approaches. The remaining chapters address efforts among law enforcement agencies to develop their own networks in an event to prevent and control organised crime and how those networks form and function. Chapter 8 concentrates on network structure, including different types of networks and their pathways to formation and key developments at a network's lifecycle. Chapter 9 focusses on

network dynamics and tensions that need to be managed within law enforcement networks. Finally, the book concludes briefly with reflections on the practical applications of understanding and analysing criminal networks and law enforcement networks and suggestions for further research in this field.

Note

1 For a more detailed account of our data and method, see Bright and Whelan (2019), and Whelan and Bright (2020). In short, interviews were conducted in 2015–16, transcribed and coded in NVivo 11, and analysed thematically.
