EVALUATION OF TEACHING QUALITY IN HIGHER MILITARY EDUCATIONAL INSTITUTIONS: METHODOLOGICAL FOUNDATIONS

The purpose of this article is to conduct a comprehensive study of the specific features of evaluating the quality of teaching by instructors in higher military educational institutions, with a particular focus on the National Academy of Land Forces named after Hetman Petro Sahaidachnyi. The emphasis is placed on the methodological foundations of implementing and functioning of the lesson evaluation system as a tool

© *Kravets T., Bahmat M.*

for enhancing the quality of the educational process and improving the professional performance of academic staff. The study analyzes the practical experience of applying the evaluation system, its impact on teaching effectiveness, cadet engagement, depth of learning, and the overall preparedness of future officers. Special attention is given to issues of ensuring objectivity and transparency in evaluation, minimizing subjective factors, and aligning national approaches with international standards, particularly NATO recommendations. The methodological basis of the research includes the analysis of regulatory documents, statistical data, and survey results of both cadets and instructors. The article presents an evaluation algorithm that covers key aspects: organizational preparation of the instructor, logical structure and clarity of material presentation, active interaction with the audience, use of visualization tools, digital technologies, and modern teaching methods. The article also discusses approaches to adapting the evaluation system to the specific nature of higher military education, including its integration with other elements of the quality assurance system. As a result of implementing the system, an increase in the professional level of instructors, enhanced motivation for methodological work, greater cadet engagement in the learning process, and the formation of an effective feedback mechanism were observed. The data analysis shows that instructors who consistently receive high evaluations demonstrate greater initiative in implementing innovative methods, digital tools, and in improving their own teaching proficiency. The practical significance of the article lies in forming methodological foundations for building an effective system of instructional quality evaluation, which contributes to the further development of higher military education and its adaptation to modern challenges.

Keywords: lesson evaluation system; higher military educational institutions; instructional activity; quality of the educational process; instructor motivation; military personnel training; teaching methods; professional development.

1. INTRODUCTION

The problem statement. In the current context of military education reform, ensuring the high quality of the educational process and the effectiveness of teaching activities has become particularly relevant. One of the

key tools to achieve this goal is the implementation of an instructor evaluation system, which not only allows monitoring the level of teaching but also promotes its continuous improvement. Objective evaluation of the quality of conducted classes enables the analysis of the strengths and weaknesses of the educational process, which serves as the foundation for improving the training of future officers.

However, the implementation of an instructor evaluation system in higher military educational institutions is accompanied by a number of challenges. The main issues include the need to ensure objectivity in evaluation, to eliminate subjective influence during the assessment of classes, and to develop unified evaluation criteria that take into account the specifics of military education. Methodological justification of the evaluation system is also a critical aspect, which should include a balance between formative and summative analysis, as well as mechanisms for providing constructive feedback to instructors.

Additional challenges are related to the technical aspects of the evaluation process, particularly the need to automate data collection, analysis, and processing. This will contribute to greater transparency and minimize potential errors or bias in result interpretation. Another important factor is the training of personnel responsible for conducting evaluations, which requires the development of methodological guidelines, training programs, and standards for evaluators.

Insufficient integration of the instructor evaluation system into the broader framework of quality assurance in education may reduce its overall effectiveness and slow down its implementation. Special attention should be paid to the development of clear evaluation criteria that allow for a comprehensive analysis of teaching performance, as well as to the creation of incentive mechanisms to encourage instructors to improve their teaching methods. The absence of proper motivational measures may lead to a formal approach to evaluation, thereby reducing its impact on the quality of military education.

Therefore, this article aims to analyze the challenges associated with the implementation of instructor evaluation systems in higher military educational institutions and to develop recommendations for optimizing such

systems to enhance the quality of education, promote professional growth of instructors, and improve the training of military personnel.

Analysis of recent research and publications. The analysis of recent research and publications reveals a growing interest in improving the quality of military education through the enhancement of instructor evaluation systems. Scientific studies have examined various aspects of this topic, including methodological, organizational, and practical challenges.

In particular, the article by I. Danyliuk titled "Some Approaches to Determining the Quality of Teaching in Higher Military Educational Institutions" [1] discusses methods for assessing the quality of instruction, emphasizing the importance of feedback between instructors and cadets to ensure an effective learning process.

The monograph edited by Professor M. Medved "The System of Internal Quality Assurance in Higher Military Educational Institutions: Features and Development Conditions" [2] explores the functioning of internal quality assurance systems in education, including the evaluation of academic and teaching staff. The authors highlight the need to develop clear evaluation criteria that reflect the specifics of military education, as well as the implementation of feedback systems to promote continuous educational improvement.

The article "Instructor Professionalism in Military Higher Educational Institutions as a Component of the Internal System" [3] analyzes the features of internal quality assurance systems at the instructor level in military HEIs and their role in maintaining educational standards.

Special attention should also be given to the regulatory documents governing the instructor evaluation systems in Ukrainian higher military educational institutions. The National Defence University of Ukraine named after Ivan Cherniakhovskyi developed the "Regulations on the Rating Evaluation of Academic and Teaching Staff Activities", which outlines the main principles of instructor evaluation, including rating indicators that consider the scientific, methodological, and teaching activities of personnel [4].

The Naval Forces Institute of the National University "Odesa Maritime Academy" has also implemented an instructor evaluation system in its own "Regulations on the Rating Evaluation of Academic and Teaching Staff

Activities" [5], which define evaluation criteria tailored to the specifics of training naval professionals.

Foreign researchers have also addressed this topic. The article "Training of Military Professionals in Leading Countries of the World" summarizes international experience and identifies the fundamental principles and trends in military educational system development, including aspects of instructor assessment [6]. In particular, R. Johnson in "Evaluation Systems in Military Education: Best Practices and Challenges" [7] analyzes advanced approaches to instructor evaluation in military academies, focusing on standardized methods and their effectiveness. J. Smith and L. Thompson in "Enhancing Instructor Performance in Military Academies: A Comparative Analysis" [8] examine mechanisms for improving instructor productivity through the implementation of comprehensive evaluation systems.

Williams A. investigates the introduction of 360-degree feedback in military institutions in the work "Implementing 360-Degree Feedback in Military Training Institutions" [9], emphasizing the importance of multisource instructor assessment. In "Assessing Teaching Effectiveness in Military Contexts: Methodologies and Outcomes", T. Nguyen and S. Lee [10] explore teaching effectiveness assessment methods in military institutions, focusing on practical approaches to personnel training. Finally, M. Garcia in "Professional Development and Evaluation in Naval Academies" [11] examines professional development and instructor evaluation systems in naval academies, highlighting the role of regular review and adaptation of teaching methods to meet evolving training requirements.

These studies provide a foundation for the development and refinement of instructor evaluation systems in higher military educational institutions, though they require adaptation to the unique characteristics of military education. However, none of the studies has proposed a standardized evaluation system that can be applied across all military HEI specialties.

The purpose of this article is to explore and justify the effectiveness of implementing a class evaluation system for instructors in higher military educational institutions, focusing on the practical methods used to assess teaching performance. The article examines the structure and content of evaluation tools, outlines the main assessment criteria, and analyzes how

these are applied during the observation and review of instructional activities. Particular emphasis is placed on the clarity, consistency, and applicability of these methods in evaluating the quality of classes, as well as their alignment with international military education standards, especially NATO guidelines.

This article also highlights the practical role of class evaluation systems as a means to improve teaching quality, support the professional development of instructors, and foster their motivation for continuous improvement. Additionally, it addresses the integration of these systems into broader quality assurance frameworks in higher military education and considers the potential for their automation to improve the effectiveness and transparency of performance analysis.

2. THE RESULTS AND DISCUSSION

The system for evaluating instructors' classroom performance is an important component of both educational quality assurance and the professional development of educators. Various evaluation systems apply different approaches depending on their purpose: some focus on teaching improvement (formative assessment), while others aim at accountability and quality control (summative assessment). In general, methods for assessing teaching quality can be categorized as quantitative, qualitative, or combined. Often, evaluation systems are developed in a balanced manner, integrating several approaches simultaneously.

Quantitative methods involve the numerical representation of results. These may include instructor ratings on a scale, statistical indicators of student performance, or the percentage of material assimilation. In some systems, student test or exam results are used as indicators of lesson effectiveness; however, this approach remains debatable, as cadet (student) achievement is influenced by numerous external factors. Quantitative methods are convenient for comparison and monitoring progress over time but may fail to account for all aspects of pedagogical competence.

Qualitative methods are based on descriptive analysis and expert judgment. These include peer observation with subsequent feedback, analysis of lesson video recordings, peer review, instructor self-assessment, and teach-

ing portfolios. Such methods allow for a deeper understanding of pedagogical processes and provide contextual feedback, such as how clearly the material is delivered or what the atmosphere in the classroom is like. A potential drawback of qualitative methods is their subjectivity, particularly if feedback is given without clear evaluation criteria or if the evaluator lacks proper training.

Combined methods are employed in most modern evaluation systems and aim to integrate both quantitative and qualitative data for a comprehensive assessment. A comprehensive evaluation, for instance, may include the results of student surveys, scores based on standardized observation rubrics, and indicators of cadet (student) academic achievement. This mixed approach increases the objectivity and reliability of evaluations by accounting for multiple dimensions of teaching performance. Research shows that applying multiple methods allows coverage of a broad range of pedagogical skills and reduces the influence of bias from a single information source.

It is also essential to differentiate evaluation approaches based on their intended purpose: formative assessment, used for developmental purposes, can be informal and trust-based, whereas summative assessment, applied for staffing or administrative decisions, must be more standardized and independent. To ensure fairness and usefulness, clear criteria for evaluating classroom instruction are established. These criteria usually include the instructor's professional competence, teaching methodology, and interaction with cadets (students). Typical indicators used in assessing a lesson may include the instructor's subject knowledge and competence (the degree to which the instructor masters the material and whether the content is up-to-date and relevant, supported by references to modern research and practice); clarity and accessibility of presentation (the ability to explain material clearly, logically, and coherently, including the use of structured lessons and the simplification of complex concepts); engagement and motivation (the ability to captivate the audience, maintain attention, and encourage active participation through interactive methods, discussions, or practical examples); communication and interaction skills (the ability to establish contact with the audience, demonstrate respectful behavior, and respond to questions effectively, while also maintaining a high level of speech culture and language

correctness); objectivity and fairness (unbiased assessment, transparency in grading criteria, and equal treatment of all cadets or students); organization and discipline (punctuality, adherence to time constraints, a well-structured lesson, and effective classroom management); methodological proficiency (use of diverse instructional methods tailored to various learning styles, innovativeness, and the incorporation of visual aids or technologies); and the connection to practice and cadet development (the ability to demonstrate the relevance of the material to the future professional activities of military personnel).

Based on the aforementioned criteria, we developed a standardized instructor evaluation form. Another essential component that we considered was the alignment of the form's components with NATO standards. The need for the creation of a new type of evaluation form arose when we began searching for methods to conduct high-quality and unbiased class monitoring and discovered that, although instructor evaluation practices existed in higher military educational institutions in Ukraine, no clearly standardized forms had been developed.

The classroom observation form used at the Hetman Petro Sahaidachnyi National Army Academy serves as an effective tool for evaluating teaching performance, providing a comprehensive analysis of a conducted lesson based on a set of clearly defined criteria. It was developed in accordance with the provisions of the NATO Strategic Commands' Joint Directive "Education and Individual Training" (E&ITD) 075-007, which confirms its compliance with international military education standards. The primary objective of this form is to create a transparent, detailed, and structured mechanism for evaluating instruction, enabling instructors to receive feedback that can support the improvement of their teaching methodology and the enhancement of the overall quality of the educational process (see Table 1).

The form consists of several key sections, each covering different aspects of lesson delivery. The first section includes general information about the lesson, such as the date, the department, the subject, the type of lesson, the topic, as well as the names of the instructor and the evaluator. This allows for the identification of the lesson and its organizational parameters. The following section presents the results of the classroom observation, including

the evaluation of supporting documentation, organization of the learning process, instructional effectiveness, cadet engagement, and the final review of the session. The evaluation of teaching involves a detailed analysis of the logical structure of the lesson, the instructor's use of examples, statistical data, supplementary materials, and interaction with learners. This makes it possible to obtain an objective view of how effectively the material is delivered and whether it meets established educational standards.

Table 1

Observation Results of the Lesson at National Army Academy

Statement	Yes	To some extent	No	Not applicable
Supporting Documentation				
The lesson plan and other materials required by official documents are available and approved				
Written recommendations were provided to cadets (students) prior to the lesson				
The topic and title of the lesson correspond to those in the curriculum				
The training questions correspond to those in the curriculum				
Lesson Organization (Beginning)				
The group arrived on time, with no unauthorized absentees				
The classroom (venue, material base) is prepared and matches the form of the lesson.				
The instructor has a good command of the lesson material				
The instructor reviewed the previous topic and transitioned to the current one				
The instructor convincingly presented the relevance of the lesson				

Continuation of the Tabl. 1

Statement	Yes	To some extent	No	Not applicable
The instructor determined the group's readiness for the lesson				
The instructor explained the procedure of the lesson and actions in response to signals				
The instructor clarified the evaluation procedure during the lesson				
The expected outcome is clearly stated, appropriate to the knowledge level, attainable, and will be assessed				
Primary and supplementary information sources are visually presented				
Teaching Effectiveness				
The instructor captured and maintained audience attention				
Training topics were presented in a logical sequence				
The instructor provided necessary information (examples/explanations/statistics/experience)				
Visual aids used were clear and supported the teaching of the subject				
Supplementary materials for the lesson were easily accessible				
Multimedia materials used were sufficient in quantity, appropriate in duration and quality				
The instructor engaged cadets/students during the lesson using effective teaching techniques				
The instructor emphasized key points and problematic issues				

End of Tabl. 1

Statement	Yes	To some extent	No	Not applicable
The instructor periodically checked cadets' (students') understanding of the material				
The instructor summarized key training points at the end of the lesson				
Cadet performance corresponds to the expected outcomes and the lesson plan				
Cadet Evaluation				
Evaluation is conducted according to the established depth of knowledge				
Benchmark answers for evaluation are available				
Evaluation aligns with expected outcomes				
The content evaluated corresponds to what was taught during the lesson				
Lesson Organization (Ending)				
Grades based on the lesson results were communicated				
The instructor conducted a lesson summary				
Feedback was obtained				
Independent study assignments were given				
The procedure for catching up on missed material or poor performance was explained				
The lesson duration corresponds to the planned schedule				

Particular attention in the observation form is devoted to the assessment of cadets, which includes the alignment of knowledge assessment methods with educational process standards, the availability of benchmark answers, and the correspondence between evaluated content and the ma-

terial delivered during the lesson. This provides the instructor with clear information on cadet comprehension and allows for timely responses to problematic aspects. Equally important is the section dedicated to the organization of the lesson's conclusion, which includes summarizing key points, providing feedback to cadets, and assigning tasks for independent study. This contributes not only to better knowledge retention but also to the development of independent learning skills among cadets.

The final evaluation of lesson quality in the form is represented through the determination of the level of achievement of expected outcomes and includes the evaluator's recommendations for improving instruction. A significant feature is the section intended for the department head's conclusions and the instructor's commitments to address identified shortcomings. This not only records deficiencies but also establishes a mechanism for monitoring their correction.

One of the key advantages of this form is its comprehensive approach to evaluation, allowing for detailed analysis of every aspect of instructional activity, unlike traditional assessment methods, which are often limited to general conclusions. Objectivity in evaluation is another important benefit-clearly structured criteria help minimize the subjective influence of evaluators. The use of clear response options ("Yes", "To some extent", "No", "Not applicable") reduces subjectivity and ensures a transparent process of lesson analysis.

Another advantage is compliance with international standards, as the form is based on NATO directive Bi-SC 075-007, which makes the evaluation system modern and adapted to the requirements of international military cooperation. At the same time, this assessment tool accounts for the specifics of military education, particularly the importance of both theoretical knowledge and practical training, which are essential for developing combat skills in future officers.

The formation of feedback also plays a crucial role, as the evaluation system is not only aimed at identifying shortcomings but also at resolving them. The instructor has the opportunity to review the evaluation results, receive specific recommendations for improving instruction, and implement necessary changes. This encourages educators toward continuous pro-

fessional development and helps raise the overall quality of instruction in higher military educational institutions.

Moreover, the focus on practical skills is one of the defining characteristics of this evaluation form. It not only assesses teaching competence but also analyzes the instructor's ability to engage the audience, use modern didactic tools, and maintain discipline during the lesson. This is especially important in military education, where effective delivery and the ability to retain cadet attention are of critical importance.

The flexibility and adaptability of the form allow for quick adjustments to the evaluation system in line with new approaches to military training. Unlike civilian educational methods, which often focus on academic achievements, this form enables the inclusion of combat training realities and the specific requirements of military discipline. Another significant advantage is the ability to monitor implementation of recommendations, as instructors must formally confirm improvements made in response to evaluation outcomes.

Thus, the lesson observation form used at the National Army Academy is an effective, modern, and comprehensive tool for evaluating instructors, providing a thorough analysis of lesson quality. It helps determine the instructor's level of preparedness, assess pedagogical proficiency, and refine instructional methods. Its advantages include a systematic approach, objectivity, compliance with NATO standards, a feedback mechanism, and the ability to promptly adjust the educational process. As a result, the form not only ensures oversight of instructional quality but also contributes to improving the training of future officers, which is a key objective of military education.

Instructor performance evaluation makes it possible to identify the strengths and weaknesses of the educational process, improve instructors' methodological preparedness, and promote their professional development. A critical aspect is ensuring objectivity, which helps avoid subjective influences during lesson analysis and facilitates the formation of feedback mechanisms for improving teaching approaches.

To better illustrate our approach, we conducted a comparative analysis of instructor evaluation methods in military education based on NATO

standards (as per Bi-SC 075-007) and the system developed at the National Army Academy. This comparison highlights certain differences in the principles of instructional assessment, quality control mechanisms, and the ultimate goals of educational process evaluation (see Table 2). The NATO system focuses on standardized approaches to managing instructional quality, requiring alignment of training programs with international military education norms. It relies on annual evaluations, audits, and external reviews to maintain consistent standards of military professional training across Alliance member states. However, this approach is less flexible and requires considerable time for implementing changes, which may be a drawback in rapidly evolving military training environments.

Table 2

Comparative Table of Evaluation Approaches (NATO vs Academy)

Criterion	Bi-SC 075-007 (NATO)	Academy Evaluation Form
1	2	3
Quality Management System	Focused on standardized quality processes	Focused on internal instructor evaluation
Documentation Support	Approved standards for training materials	Verification of compliance with lesson plans and materials
Evaluation Methods	Comprehensive approach: needs analysis, testing, external certification	Lesson observation, evaluation of compliance with standards
Forms of Control	Annual conferences, audits, external reviews	Oversight by methodological departments and leadership
Evaluation Frequency	Annual course evaluation	Lesson evaluation as needed or within internal certification framework

End of Tabl. 2

1	2	3
Criteria for Teaching Effectiveness	Clearly defined NATO standards	Clear but flexible teaching evaluation criteria
Student Interaction	Anonymous student surveys	Engagement and communication effectiveness are assessed
Role of Evaluation in Professional Development	Evaluation is used for course accreditation and instructional improvement	Used to improve teaching skills

In contrast, the instructor evaluation system at the National Army Academy is focused on internal monitoring and improvement of the educational process, enabling a prompt response to the national needs of military education. Its primary objective is to ensure effective teaching through the analysis of lesson alignment with curricula, instructional methods, and cadet knowledge retention. As such, the system allows for the timely identification of strengths and weaknesses in teaching performance, providing opportunities for continuous improvement.

Evaluation within the NATO system is based on standardized criteria that include student testing, course effectiveness analysis, and external instructor certification. At the Academy, the key evaluation method is direct observation of lessons and assessment of instructor preparedness, cadet engagement, use of didactic materials, and application of modern technologies. This approach enables a more detailed analysis of instructional methodology and accounts for the specific nature of disciplines – an essential factor in military education, which emphasizes not only theoretical knowledge but also practical skills.

A significant advantage of the Academy's system is its adaptability – lesson evaluations are conducted not only during scheduled certifications but also as needed, allowing for prompt adjustments to instructional delivery. This flexibility represents a major benefit compared to NATO's annual in-

spections, which, while ensuring standardization, may not always reflect the current challenges of the learning environment.

Another important aspect is the assurance of objectivity in evaluation. In the NATO system, this is achieved through anonymous student surveys and independent expert reviews. At the Academy, objectivity is ensured through oversight by methodological departments and the flexible structure of evaluation criteria, which allows for assessing instructional quality not only by general standards but also by the specifics of individual disciplines.

The NATO system is largely used for course accreditation and to verify compliance with international teaching standards. In contrast, the evaluation system at the National Army Academy is primarily aimed at improving teaching methods, encouraging instructor development, and enhancing the training level of future officers. It directly assesses the instructor's contribution to cadet development while forming a clear and actionable feedback system.

Therefore, the instructor evaluation system at the National Army Academy has several advantages compared to NATO approaches. It is more flexible, allows for faster adaptation to changes in military training, provides a more detailed analysis of teaching methodology, and promotes the professional development of instructors. As a result, the system serves as an effective tool for improving the quality of military education and shaping competent military professionals.

Using an analytical method, we determined the percentage distribution of advantages of our system, based on the relative importance of each aspect of instructor evaluation in military education. The following factors were considered (Fig. 1):

The percentage distribution in the instructor evaluation system is based on the actual influence of each aspect on the quality of the educational process and compliance with NATO standards. The most important factor is the improvement of teaching quality (20 %), as it directly determines cadet preparedness and the overall effectiveness of the learning process. Evaluation enables the identification of strengths and weaknesses in instruction, supports the enhancement of teaching methods, and facilitates adaptation of the educational process to modern requirements of military training.

The second most important factor is the development of instructional skills (18 %), as the evaluation system helps instructors analyze their performance, receive constructive feedback, and refine their teaching techniques. This is especially crucial in the military domain, where methods and approaches are constantly evolving in response to updated combat training requirements. Another significant factor is adaptation to NATO standards (15 %), since the evaluation system is developed in accordance with Bi-SC 075-007, ensuring interoperability between Ukrainian military education and the international standards of the Alliance. While orientation toward these standards is essential, it is viewed as a means rather than an end in itself, and thus its impact is slightly lower than that of teaching quality.

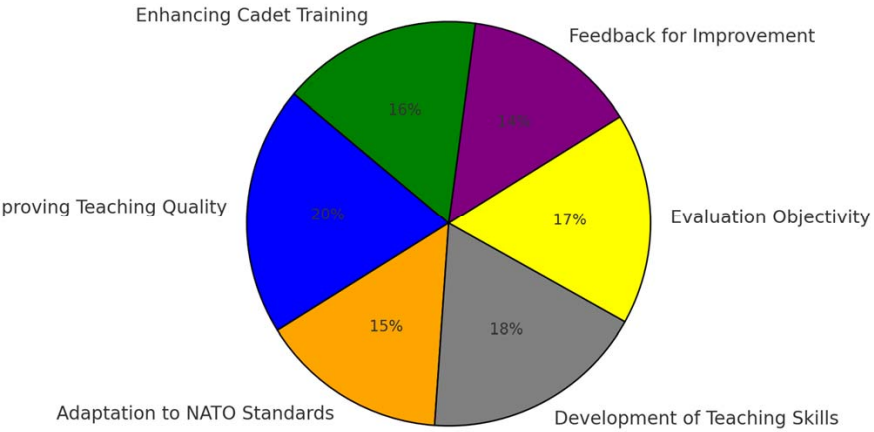

Fig. 1. Advantages of the Instructor Evaluation System in Military Education.

Evaluation objectivity (17 %) plays a critical role, as the establishment of clear criteria helps reduce subjective bias among evaluators, ensuring fair and transparent oversight of teaching. The use of standardized assessment forms eliminates potential prejudice and provides equal conditions for all instructors. Feedback (14 %) is another essential tool for improving the educational process, allowing instructors to receive specific recommendations for enhancing their teaching methods. Regular surveys, ob-

servations, and lesson reviews help identify weaknesses and implement necessary adjustments.

Enhancing cadet training (16 %) is one of the key outcomes of an effective evaluation system. High-quality instruction directly impacts the level of military personnel's combat preparedness, as fundamental knowledge required for future assignments is acquired in classrooms and during practical training. However, cadet training depends not only on instruction but also on other factors, such as field exercises and combat training, which is why its percentage share is slightly lower compared to other indicators.

Thus, the percentage distribution reflects the actual impact of each evaluation aspect on the learning process. The greatest emphasis is placed on teaching quality (20 %) and instructor development (18 %), as these serve as the foundation of effective military education. Adaptation to NATO standards (15 %) and cadet training (16 %) ensure compliance with international norms and the practical efficiency of training. Evaluation objectivity (17 %) and feedback (14 %) guarantee that the system operates fairly, transparently, and as a tool for the continuous improvement of the educational process.

Overall, the instructor evaluation algorithm in higher military educational institutions includes nine key stages, ensuring a systematic approach to analyzing teaching performance and the quality of the learning process. The process begins with the lesson evaluation stage, where the evaluator determines assessment parameters, gathers necessary documents, and reviews the class schedule. The next stage involves the verification of supporting documentation, during which the compliance of educational materials with the course curriculum, methodological guidelines, and military education standards is analyzed (Fig. 2).

The next stage involves observing the organization of the lesson, which includes evaluating discipline, classroom preparation, lesson punctuality, and the logical structure of the session. This is followed by an analysis of teaching effectiveness, where the quality of material delivery, use of didactic tools, cadet engagement in the learning process, and adaptation of teaching methods to military realities are assessed. An essential stage is the evaluation of student knowledge, which involves analyzing the level of material retention through answers to questions, completion of practical tasks, or testing.

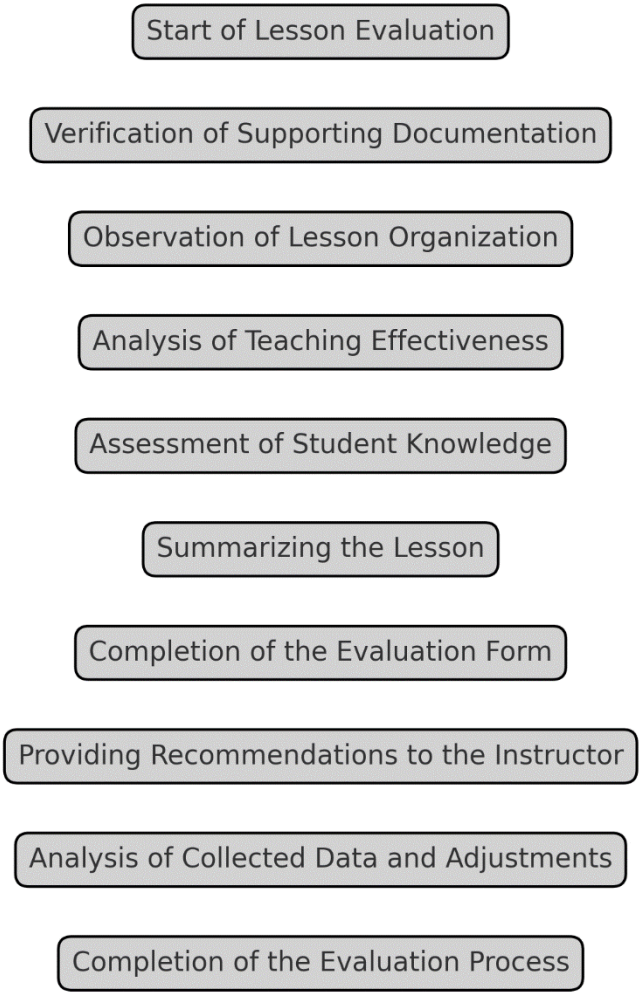

Fig. 2. Algorithm for Evaluating Academic and Teaching Staff

Summarizing the lesson allows for an assessment of how well the instructor was able to consolidate the key points of the session, verify cadet comprehension, and assign tasks for independent study. The next step is completing

the evaluation form, where all assessment results are recorded according to established criteria, including positive aspects and identified shortcomings. This is followed by providing recommendations to the instructor, which include specific suggestions for improving teaching methodology, enhancing interaction with cadets, and optimizing the learning process.

The final stage is the analysis of collected data and adjustments, which involves implementing changes in the educational process based on the received evaluations. This contributes to the continuous improvement of instructional quality, enhances cadet training, and ensures that teaching aligns with modern military education standards. The completion of the evaluation process occurs after all data has been summarized and necessary modifications have been incorporated.

The advantages of this framework lie in its structured approach, which ensures a systematic evaluation process and eliminates subjectivity, as well as its comprehensive analysis, which covers organizational, methodological, and pedagogical aspects of teaching. Another key feature is the feedback mechanism, which allows instructors to receive constructive recommendations for improving their teaching methods. The flexibility of the algorithm enables quick adaptation of evaluation criteria in response to curriculum updates or changes in military training requirements. Overall, this framework establishes an effective quality control mechanism for lessons and contributes to enhancing the training of future officers.

3. CONCLUSIONS AND PROSPECTS FOR FURTHER RESEARCH

The implementation of a structured instructor evaluation system in higher military educational institutions plays a pivotal role in strengthening the quality of instruction and enhancing the professional development of the teaching staff. This system enables the identification of both strengths and shortcomings in teaching practices, ensuring a targeted and data-informed approach to pedagogical improvement. Empirical data from internal evaluations, combined with structured observation protocols, demonstrate that consistent application of evaluation criteria correlates with measurable improvements in instructional performance, student engagement, and learning outcomes.

One of the most tangible outcomes of the evaluation system is the rise in instructors' motivation to adopt contemporary teaching techniques. Instructors who consistently receive positive evaluations are demonstrably more inclined to integrate interactive technologies, diversify their teaching methods, and maintain higher levels of engagement with cadets. This directly contributes to improved academic discipline and higher levels of material comprehension among cadets, as evidenced by improved assessment scores and increased participation in lessons.

The system also reinforces institutional accountability by introducing structured mechanisms for feedback and follow-up. The ability to track performance trends over time allows department heads to monitor professional growth and identify systemic issues in instruction. Furthermore, adherence to clearly defined evaluation criteria – aligned with NATO quality assurance guidelines – ensures comparability, fairness, and transparency across units and departments.

Crucially, the evaluation system supports the alignment of instructional content with the dynamic requirements of modern military training. The modular design of evaluation tools allows for adaptation to changes in curricula, mission-specific training scenarios, and updated doctrinal standards. Such flexibility makes the system not only a quality control mechanism but also a driver of pedagogical innovation and responsiveness to operational needs.

Despite these advantages, further refinement is necessary. Current evaluation processes, though robust, rely heavily on manual data collection and subjective judgments. Automating data collection and integrating evaluation results into institutional learning management systems (LMS) would enhance efficiency, reduce bias, and provide more comprehensive analytics. In addition, mechanisms for ensuring the implementation of evaluator recommendations must be strengthened – ideally through documented instructor development plans and periodic progress reviews.

Prospects for further research include longitudinal studies on the impact of evaluation systems on instructional quality, the professional trajectories of instructors, and cadet performance in field conditions. Comparative analyses of evaluation frameworks across NATO military

academies may also yield insights into best practices and cross-institutional benchmarking. Finally, integrating artificial intelligence tools for real-time feedback and personalized recommendations represents a promising frontier in elevating both teaching quality and institutional learning culture.

Кравець Т., Бахмат М. ОЦІНЮВАННЯ ЯКОСТІ ПРОВЕДЕННЯ ЗАНЯТЬ У ВИЩИХ ВІЙСЬКОВИХ НАВЧАЛЬНИХ ЗАКЛАДАХ: МЕТОДОЛОГІЧНІ ЗАСАДИ

Метою цієї статті є комплексне дослідження особливостей оцінювання якості проведення занять викладачами у вищих військових навчальних закладах, зокрема в Національній академії сухопутних військ імені гетьмана Петра Сагайдачного. Акцент зроблено на методичних засадах впровадження та функціонування системи оцінювання занять як інструменту підвищення якості освітнього процесу та вдосконалення професійної діяльності науково-педагогічних працівників. У дослідженні проаналізовано практичний досвід застосування системи оцінювання, її вплив на викладацьку ефективність, рівень залученості курсантів, глибину засвоєння навчального матеріалу та загальний рівень підготовки майбутніх офіцерів. Особливу увагу приділено питанням забезпечення об'єктивності та прозорості оцінювання, мінімізації суб'єктивного чинника, а також відповідності національних підходів міжнародним стандартам, зокрема рекомендаціям НАТО. Методологічну основу дослідження становлять аналіз нормативно-правових документів, статистичні дані та результати опитування курсантів і викладачів. У статті представлено алгоритм оцінювання занять, який охоплює ключові аспекти: організаційну підготовку викладача, логічність і доступність подання матеріалу, активну взаємодію з аудиторією, застосування візуалізацій, цифрових технологій і сучасних педагогічних методик. Розглянуто підходи до адаптації системи оцінювання до специфіки вищої військової освіти, включаючи її інтеграцію з іншими елементами системи забезпечення якості освіти. У результаті впровадження системи було зафіксовано зростання професійного рівня викладачів, підвищення мотивації до методичної роботи, посилення залученості курсантів до навчального процесу, а також формування дієвого механізму зворотного зв'язку. Аналіз

даних свідчить, що викладачі з високими результатами оцінювання демонструють більшу активність у впровадженні інноваційних підходів, цифрових засобів навчання та підвищенні власної педагогічної майстерності. Практичне значення статті полягає у формуванні методичних засад для розбудови ефективної системи оцінювання якості викладання, що сприятиме подальшому розвитку вищої військової освіти та адаптації до сучасних викликів.

Ключові слова: система оцінювання занять; вищі військові навчальні заклади; викладацька діяльність; якість освітнього процесу; мотивація викладачів; підготовка військовослужбовців; методика викладання; професійний розвиток.
